User Manual: AI NutriBot

The simplest, fastest, and safest way to track your nutrition.

IA NutriBot revolutionizes how you log your daily habits. Designed to work intuitively and without friction, this AI-powered assistant accompanies you step by step, managing your nutritional logs directly from Telegram.

Main Advantages

- **Total privacy and guaranteed anonymity:** Your peace of mind is our priority. We do not require traditional registration, passwords, emails, ID documents, or bank details. Registration is done solely with your biometric measurements and you can use a pseudonym.
- **Zero installations:** Forget about downloading heavy apps or accepting invasive permissions. IA NutriBot works 100% within your Telegram account.
- **Smart and natural logging:** Say goodbye to endless ingredient lists. To log your meals, you just need to send a photo of your plate, an audio message, or a simple text. The AI analyzes the food and automatically calculates calories, fiber, carbs, protein, and fat.
- **Automatic logging and evolution:** Your information is stored securely to generate your history without manual notes. The system generates automatic evolution reports (weekly and monthly) that you will receive in your chat, including weight variation estimates.
- **International precision calculations:** We use internationally validated formulas, such as the US Navy method. Exclusive for adults, the calculation takes exact body measurements (neck, waist, and for women, hips) to guarantee estimates of maximum scientific precision.
- **Integrated professional tracking:** If you are undergoing treatment, you can enter your doctor or nutritionist's Telegram ID upon registration. This will allow the professional to monitor your progress instantly and remotely.

⚠ **Important Medical Warning:** IA NutriBot is an advanced automated calculation tool aimed at practical caloric tracking. The assistant does not issue diagnoses, diets, or medical recommendations. Its function is strictly limited to providing quantitative estimates based on international nutrition tables. All clinical or nutritional monitoring must be carried out exclusively by a registered and competent health professional.

1. Ingestion Logging Methods

Artificial intelligence is at your service for natural and ultra-fast logging. You do not need to navigate complex menus; the system is designed to understand colloquial language and process nutritional data instantly.

A. Colloquial Entry: Photo, Audio, or Text

The golden rule is simple: the more details you provide to the AI, the more accurate the calculations will be.

- **By photograph:** Send a direct photo of your plate. Although the AI has excellent visual recognition, we recommend accompanying the image with a brief description. Example: When sending a photo of empanadas, clarify if they are baked or fried, the type of filling, and if they are homemade or industrial. If you know the exact weight of the portion, add it for perfect precision.
- **By voice note:** Dictate your intake via audio completely naturally, detailing the foods and estimated amounts or portions. The AI will convert the audio to text and process the data.
- **By free text:** Write what you consumed descriptively. Example: "Two scrambled eggs with whole wheat toast and a cup of coffee with milk".

B. Barcode or Packaging Scanning

If you consume a packaged product, you have two quick options to log it:

- **Barcode photo:** Send the barcode photo (or enter the number manually) so the system can consult the international database. If the information is available, it will present the breakdown per 100 grams for you to adjust the consumed portion.
- **Frontal product photo:** If the code is not in the database, simply take a photo of the front of the packaging where the product and net weight are clearly readable. The AI will analyze the image and automatically extract the nutritional values.

C. Quick Logging with Preloaded Spreadsheets

For meals you repeat frequently, the bot allows you to save your own combinations in a personal spreadsheet.

- Once the combination is saved under a short code (e.g., "breakfast"), logging it takes a second.
- You just have to send an asterisk (*) followed by the code (example: *breakfast or *pizza).
- The system will instantly load the plate into your daily log without the need for further processing.

2. The Web Nutritional Calculator

IA NutriBot has an interactive web module to process your homemade recipes made with multiple ingredients and save them for future use. To access, send the **/recipe** command. The bot will respond with a unique and personalized web link, linked exclusively to your user, where you must complete:

- **Code Name:** Choose a short keyword to invoke the recipe (e.g., CAKE). If you use an already registered word, the system will automatically assign a sequential number (e.g., CAKE2).
- **Food description:** A supporting text using clear keywords (chicken, meat, pork, whole wheat bread) that the system will use to correctly process your monthly summary and statistics.
- **Ingredients and quantities:** Detail the complete list of components along with their exact quantity.
- **Division criteria:** Select how you want to divide the recipe for consumption:
    - By portions: Ideal for whole preparations (pizzas, tarts). Indicate how many portions it was divided into and the system will calculate the exact values of each one.
    - Per 100 grams: Ideal for sponge cakes or preparations by weight.
- **Personal spreadsheet consultation:** To see the complete list of saved meals, send the **/food** command. You will be able to view the details and download the complete spreadsheet in PDF format.

3. Corrections and Log Management

The system is 100% flexible and allows you to easily correct erroneous entries or clean your personal database.

A. Deleting Ingestions or Physical Activities

If you entered data on an incorrect date or time, use the **/del** command.

1. Type **/del** in the chat.
2. The bot will show interactive buttons to select the Day and Time (for example, "Lunch").
3. The exact detail of what was loaded in that segment will be displayed.
4. You can delete the entries one by one to avoid accidental deletions and re-enter the correct data.

B. Cleaning Preloaded Meals

If a saved recipe is no longer useful or you wish to update it, use the **/delmeal** command. This command permanently deletes the default

preparations from your personal spreadsheet, keeping your list organized exclusively with what you consume.

4. Reports, Statistics, and Control

Visualize your progress through detailed summaries and automatic reports, without the need for manual calculations.

A. Nutritional Ingestion Reports

- **Daily Report (/day):** Shows the fine detail of the four main meals of a specific day (today, yesterday, or another date) and generates a PDF report to download.
- **Weekly Report (/week):** Issued automatically every Tuesday. If requested manually between Tuesday and Sunday, it shows the progress of the current week; if requested on a Monday, it summarizes the entire previous week.
- **Monthly Report (/month):** Generated automatically on the 20th (partial cutoff) and the 5th of the following month (final cutoff). When requested manually, it displays buttons to choose the month to consult. (Note: If requested before the 10th of the current month, the button for that month will not appear due to insufficient data to evaluate progress).

B. Health and Blood Pressure Reports

- **Blood Pressure Control (/pressure):** In addition to logging new measurements, it allows you to consult the history. When performing a monthly query, it shows the average for the period and offers the option to download a detailed PDF with all daily readings.

5. Health and Physical Activity

IA NutriBot intelligently integrates your health metrics and daily physical exertion.

A. Blood Pressure Logging

- **Manual entry:** Entering the values directly by text.
- **Automatic reading (Photograph):** Take a photo of your digital blood pressure monitor screen. The AI will read the maximum, minimum pressure, and pulse automatically. The system will ask you to confirm, cancel, or add an explanatory note before saving the data.

B. Physical Activity Logging and History

- **Smart logging (AI Calculation):** Send a text or audio indicating the type of exercise, duration in minutes, and intensity. The AI will cross-

reference this data with your physical parameters to estimate caloric expenditure. You can validate or edit this value before saving it.

- **Exact manual logging:** If you use a smartwatch and know the exact calories, use the **`/activity`** command. The system will prompt you for minutes, calories, and a brief description. To get your monthly summary, use **`/activity`** `month` to select the month and receive your activity details along with the option to download a detailed PDF.

C. Monthly Weight Update

To maintain the accuracy of metabolic calculations, it is required to update your weight monthly using the **/weight** command (e.g.,**/weight** 75.5).

- If it is not updated, you can continue logging data, but the issuance of evolution reports will be temporarily suspended.
- Flexibility: If you update your weight after the 25th of the month, the system will automatically take it as valid for the entire following month.

6. Proactive Monitoring and Automatic Alerts

IA NutriBot works in the background to help you maintain consistency in your logs through friendly reminders.

- **Missing Ingestions Check:** The system evaluates your activity twice a day. If it detects the absence of any of the four main meals in the last 48 hours, it will send a proactive reminder (e.g., "You forgot to log yesterday's dinner").
- **Weekly Blood Pressure Reminder:** Once a week, the bot evaluates your history. If you did not log controls in the previous week, it will send a preventive notice to encourage the habit and maintain a complete history.

Quick Command Glossary

Setup and Profile

- **/register:** Initial anonymous registration process. Requests biometric data (waist, neck, weight, height, and date of birth) to perform high-precision calculations.
- **/profile:** Shows configured biometric data and parameters, allowing them to be updated via an interactive menu.
- **/weight:** Quick access for body weight update.

Reports and Tracking

- **/day:** Shows the calorie and macronutrient summary for the requested day, with an option to download in PDF.
- **/week:** Presents the detailed balance and nutritional summary of the days elapsed in the week.
- **/month** Displays the consolidated balance of the requested month and evaluates goal achievement.
- **/pressure:** Logs blood pressure or requests the monthly PDF report.

Food Logging and Management

- **/barcode:** Allows manual entry of a barcode number.
- **/activity:** Records physical activity manually or requests a detailed monthly summary using `/activity month`.
- **/del:** Deletes specific ingestion or activity logs via interactive buttons.
- **/food:** Shows saved recipes in preloaded spreadsheets and allows them to be downloaded in PDF.
- **/recipe:** Generates a web link to create and save custom recipes.

General Help

- **/help:** Displays a complete summary with the list and description of all available commands.
